(FOR RESEARCH USE ONLY. DO NOT USE IT IN CLINICAL DIAGNOSIS !)

T2(T-2 Toxin) ELISA Kit

Catalog No: E-TO-E004

96T

This manual must be read attentively and completely before using this product.

If you have any problems, please contact our Technical Service Center for help.

Website: www.elabscience.com

Please kindly provide us the lot number (on the outside of the box) of the kit for more efficient service.

Test principle

This kit uses one-step-competitive-ELISA as the method. It can detect T2 in samples, such as corn, rice, beans, peanuts, oats, formula feed, etc. This kit is composed of Micro ELISA Plate, HRP conjugate, antibody, standard and other supplementary reagents. The micro-plate provided in this kit has been pre-coated with T2. During the test, T2 in the samples competes with T2 on the pre-coated Micro ELISA Plate for sites of T2 antibody (antibody working solution). At the same time, T2 toxin antibody bonds the enzyme-marked secondary-antibody (enzyme conjugate), and TMB substrate is added for color development. There is a negative correlation between the OD value of samples and the concentration of T2. The concentration of T2 in the samples can be calculated by comparing the OD of the samples to the standard curve.

Technical indicator

Sensitivity: 0.05ppb(ng/mL)

Reaction mode: 25°C, 30min~15min

Detection limit:Nuts/corn/oats/peanuts/formula feed---6ppb

Sample recovery rate:Nuts/corn/oats/peanuts/formula feed---110% ± 15%

Kits components

Item	Specifications
Micro ELISA Plate	96 wells
Standard Liquid(black cap)	1mL each (0ppb,0.05ppb,0.15ppb,0.45ppb,1.35ppb,4.05ppb)
High Concentrated Standard (1ppm)	1mL
HRP Conjugate	6mL
Antibody Working Solution	6mL
Substrate Reagent A(white cap)	6mL
Substrate Reagent B(black cap)	6mL
Stop Solution (yellow cap)	6mL
20× Concentrated Wash Buffer(white cap)	40mL
Product Description	1 copy
Plate Sealer	1 piece
Zip-lock bag	1 piece

Other supplies required

Instruments:Microplate reader, Printer, Homogenizer, Oscillators, Centrifuge, Graduated pipette, Balance(sensibility 0.01g), Funnel, Fitter paper.

High-precision transferpettor:Single channel (20-200μL, 100-1000μL), Multichannel (300μL).

Reagents:Methanol, Deionized water.

Experimental preparation

Bring all reagents and samples to room temperature before use.

Open the micro-plate reader in advance, preheat the instrument, and set the testing parameters.

1. Sample pretreatment Notice: experimental apparatus should be clean, and the pipette should be disposable.

2. Solution preparation

Solution 1 (sample extracting solution): 60% methanol. Methanol (volume): deionized water (volume) = 3:2.

3. Sample pretreatment procedure

Pretreatment of nuts, corn, oats, peanuts, and formula feed:

- (1) Weigh 1g of crushed homogenate in to 50mL EP tube, add 20mL of sample extracting solution, oscillate for 5min, centrifuge at 4000r/min for 5min at room temperature (or filtered by quantitative analysis paper);
- (2) Take the supernatant, and dilute it with distilled water or deionized water at 1:5 (i.e., take 1mL supernatant + 5mL deionized water);
- (3) Take 50 μ L for detection and analysis

Note: Sample dilution factor: 120, minimum detection dose: 6ppb

Assay procedure

Centrifuge the sample again after thawing before the assay. Bring all reagents to room temperature for 30 min before use. **All the reagents should be mixed thoroughly by gently swirling before pipetting.**

Avoid foaming. Dilute 40mL of concentrated wash buffer into 800mL wash working buffer with deionized or distilled water before experiment.

1. **Number:** number the sample and standard in order (multiple well), and keep a record of standard wells and sample wells.
2. **Add sample:** add 50 μ L of Standard, Blank, or Sample per well, then add 50 μ L of HRP conjugate to each well, then add 50 μ L of antibody working solution, cover the plate with sealer we provided, oscillate for 5s gently to mix thoroughly, incubate for 30min at 25 $^{\circ}$ C.
3. **Wash:** uncover the sealer carefully, remove the liquid in each well. Immediately add 250 μ L of wash working buffer to each well and wash. Repeat wash procedure for 5 times, 30s intervals/time. Invert the plate and pat it against thick clean absorbent paper (If bubbles exist in the wells, clean tips can be used to prick them).
4. **Color Development:** add 50 μ L of substrate solution A to each well, and then add 50 μ L of substrate solution B. Gently oscillate for 5s to mix thoroughly. Incubate shading light for 15min at 25 $^{\circ}$ C.
5. **Stop reaction:** add 50 μ L of stop solution to each well, oscillate gently to mix thoroughly.
6. **OD Measurement:** determine the optical density (OD value) of each well at 450 nm with a micro-plate reader (the 450/630 nm double wavelength is recommended). This step should be finished in 10min after stop reaction.

Result analysis

1. Absorbance (%)= $A/A_0 \times 100\%$

A: Average absorbance of standard or sample

A₀: Average absorbance of Oppb Standard

2. Drawing and calculation of standard curve:

Create a standard curve by plotting the absorbance percentage of each standard on the y-axis against the log concentration on the x-axis to draw a semi-logarithmic plot. Add average absorbance value of sample to standard curve to get corresponding concentration. If samples have been diluted, the concentration calculated from the standard curve must be multiplied by the dilution factor.

For this kit, it is more convenient to use professional analysis software for accurate and fast analysis on a large number of samples.

Notes

1. Overall OD value will be lower when reagents is not brought to room temperature before use or room temperature is below 25°C.
2. During the washing procedure, if the wells turn dry, it will lead to bad linear standard curve and poor repeatability, move on to the next step immediately after wash.
3. Mix thoroughly and wash the plate completely. The consistency of wash procedure can strongly affect the reproducibility of this ELISA kit.
4. Micro ELISA plate should be covered by plate sealer. Avoid the reagents to strong light.
5. Do not use expired kit and reagents of different batches.
6. TMB should be abandoned if it turns color. When OD value of standard (concentration: 0) < 0.5 unit ($A_{450nm} < 0.5$), it indicates reagent is deteriorated.
7. Stop solution is caustic, avoid contact with skin and eyes.

Storage and valid period

Storage: Store at 2-8°C. Avoid freeze / thaw cycles.

Valid Period: 1 year, production date is on the packing box.
